

Monthly Internship Report – Sample

1. Summary of Activities

(Describe the main tasks, assignments, or projects handled this month in simple, clear points.)

This month I worked mainly at the G+3 residential building site in Kharar.

- Assisted in **marking and layout** of columns and walls using measuring tape and line dori.
- Observed and helped in **bar bending** and checking reinforcement as per drawings.
- Supported supervisor in **slump test** and cube casting for concrete quality check.
- Learnt to read **basic structural drawings** (footing, column, beam) and identify important symbols.
- Prepared a simple **daily labour and material log** (cement bags, sand, aggregate) in a register.

2. Reflections on Learning

(What practical knowledge did you learn and how does it connect with what you studied in class?)

- In class we studied **Surveying and Building Construction**; at site I saw how center line, right angles and levels are actually marked on ground using tape and spirit level.
- The **Reinforced Cement Concrete (RCC)** concepts from Theory of Structures helped me understand why clear cover, bar spacing and lap length are important for safety.
- I understood the **slump test** procedure which we had only done once in the lab; here I saw how site engineers use tests to decide if concrete is workable or needs adjustment.
- I realised why **accurate drawings** are important: one mistake in dimension can change the whole room size and affect brickwork.
- I gained confidence in talking to masons and helpers, and understood the roles of contractor, engineer and supervisor at site.

3. Challenges Faced and How I Addressed Them

(Mention real difficulties and what you did to overcome them.)

- **Understanding drawings:** Initially I found it difficult to read structural drawings and locate the same position on site. I started spending 15 minutes daily with my supervisor where she explained one drawing sheet and I marked important notes in my diary.
- **Technical language at site:** Workers were using many local terms (like “shuttering”, “gali”, “chajja”) which I did not fully understand. I made a

small **glossary** page in my notebook and wrote each new word with its meaning and sketch.

- **Measuring quickly and accurately:** I was slow in taking measurements. Supervisor advised me to practice using tape during free time; I practiced measuring room sizes at home and on site, which improved my speed and accuracy.

4. Plan / Focus for Next Month

(What will you focus on in the next month?)

- Learn **basic quantity estimation** for bricks, cement and steel for one floor of the building.
- Get hands-on practice in **shuttering arrangement** for slabs and beams under guidance.
- Observe and assist in **billing and documentation** (measurement book, basic bill preparation).
- Improve my drawing reading skills by revising **Building Drawing** subject and comparing with actual site conditions.
